Central/Wall Vacuum System

These instructions are to be used as a guide to help you maintain your home or office in a safe and efficient manner. They do not replace the requirements of the manufacturer. You should ALWAYS review your owner’s manual for additional preventive maintenance requirements.

This checklist is designed to detect inefficient operations. You should always review your owner's manual for specific instructions recommended by the manufacturer.

1. Inspect dirt receptacle and empty as required.
2. Inspect filter, clean or replace as required.
3. Activate unit and check suction in each wall receptacle. The suction should be about the same throughout the facility. If the suction is not the same at each receptacle, the line is partially clogged. To locate the clogged area in the system, start with the inlet closest to the power unit and check the suction. Continue to check each successive inlet until you locate the inlet where a loss in suction is occurring. The clog will be between that inlet and the previous one you checked. To remove the clog, carefully Insert an electrician’s fish tape in the inlet and push the obstruction through. Or, with another vacuum, you can reverse the suction in the system to remove the clog. If neither method is successful, contact a professional.

Take the time to do a thorough inspection. Ask if you have questions!
