**TS-0059**

**Solar Panel**

*These instructions are to be used as a guide to help you maintain your home or office in a safe and efficient manner. They do not replace the requirements of the manufacturer. You should ALWAYS review your owner’s manual for additional preventive maintenance requirements.*

This inspection is designed to maximize the efficiency of your solar panel. You should always review your owner's manual for specific instructions recommended by the manufacturer.

1. Visually inspect each panel for cleanliness. Remove dirt, grime, bird droppings, etc.
2. Visually inspect each panel for damage. If damage exists, make the necessary repairs or contact a professional.
3. Visually inspect the exposed wires (if any) for signs of wear. If the insulation is broken or cracked, make the necessary repairs or contact a professional.
4. Visually inspect the mounting brackets and mounting structures for signs of loose or missing hardware that could cause the panel to slip, move, or fall. Tighten loose brackets or contact a professional if you are unable to make the repairs.

Note: Solar panels work best when fully exposed to the sun. They should be inspected after hail storms, heavy rain and strong winds to maximize their efficiencies.

Take the time to do a thorough inspection. Ask if you have questions!
